

EQUITY DERIVATIVES IDEA · SINGLE-STOCK DECUMULATOR

A disciplined way to sell *NVIDIA* above today's price.

3-Month Daily Decumulator on NVIDIA Corp. (NASDAQ: NVDA)

You hold roughly **120,000 NVIDIA shares** — about **\$26.6m**, and the single largest line in the family book. You've said you'd like to **trim it into strength** rather than sell it all at once. This note does exactly that, automatically: a little each day, at a price **14% above where NVIDIA trades today** — and it costs you nothing upfront.

In one breath

Every trading day for three months, you sell a slice of NVIDIA at a fixed **\$252.75 — +14% above today's \$221.79**. You always sell at that price, never lower. Two conditions shape it: if NVIDIA **rallies above \$252.75** you sell **double** that day, and if it **falls 5% to \$210.70** the programme simply **stops** and you keep the rest of your shares.

How the price levels sit

Green path stays in the sweet spot all quarter · **Gold** eases to the floor and knocks out early · **Rose** rallies hard, so you sell double the whole way up.

How it actually works

- Each trading day, the bank **buys 500 NVIDIA shares from you at \$252.75** — fixed for the whole quarter, whatever the market is doing.
- On any day NVDA **closes above \$252.75**, you sell **1,000** shares instead of 500 (the "2× gearing"). You still get \$252.75 — but you've sold more while it's rising.
- If NVDA **closes at or below \$210.70** (−5%), the programme **knocks out**: it ends there, no more
- A short **5-day grace window** at the start means the floor can't end the deal in the first week.
- There is **no upfront premium** and no fee embedded in the levels — the terms are struck at fair value.
- At maturity (or knock-out) it's simply **done**: you've sold whatever shares the path delivered, all at \$252.75, and settled in cash.

selling, and you keep every remaining share.

Three ways the quarter can play out

MOST LIKELY · ~75%

It eases to the floor

\$2.27m

PROCEEDS · ~9,000 SH

NVDA drifts down and touches –5% after about **4 weeks**. You'd sold **9,000 shares at \$252.75** — well above where it now trades — then the deal stops and you still hold ~111,000 shares. **A clean, above-market trim.**

RANGE-BOUND

It chops sideways

\$7.96m

PROCEEDS · 31,500 SH

NVDA stays between the floor and the strike for the full quarter. You sell **500 a day at \$252.75** the whole time — **31,500 shares** decumulated at +14%. **The ideal outcome for this note.**

THE TRADE-OFF

It rallies +40%

\$13.14m

PROCEEDS · 52,000 SH

NVDA runs to ~\$310. You sold **1,000 a day at \$252.75** — a great absolute price, but you let go of 52,000 shares that would be worth **~\$3.0m more** if simply held. **This is the cost: capped upside.**

The honest trade-off

This is not free money — and we won't pretend it is. Because the note is struck at **fair, zero-cost value**, the 14% head-start is **paid for** by the two conditions: selling double into a rally, and stopping early in a sell-off. On a pure mathematical expectation they roughly offset.

What you are really buying is **certainty and discipline**: a guaranteed above-market exit on whatever shares trade, and a structured, unemotional way to reduce a position you've already decided is fully valued. **You never sell below today's price.** The thing you give up is the home-run — the scenario where NVDA doubles and you'd rather have held it all.

Who it suits

GOOD FIT IF YOU...

want to lighten NVDA, think it's fully valued or range-bound near-term, and value a disciplined exit above today's price.

THINK TWICE IF YOU...

are still outright bullish, need to sell the whole line by a fixed date, or can't accept selling 2x into a sharp rally.

- **Knock-out is ~75% likely** — expect a short life of ~3 weeks, not a full quarter.
- You keep full **ownership and dividends** on shares until each is sold.
- Counterparty is the issuing bank; settlement is cash against delivery at each fixing.

PRICING & MARKET DATA — AS OF 3 JUNE 2026 CLOSE

NVDA SPOT	3-MO IMPLIED VOL	3-MO USD RATE	DIVIDEND YIELD	3-MO FORWARD
\$221.79	43%	3.83%	0.02%	\$223.91

Method. The enhanced sale price is solved by Monte-Carlo simulation (300,000 risk-neutral price paths, daily steps, geometric-Brownian dynamics) so the present value of all embedded cashflows — daily sales at the strike, 2x gearing above it, and the –5% knock-out — nets to **zero at inception**. At those terms the fair strike is **\$252.75 (+14.0% vs spot, +12.9% vs the 3-month forward)**. Across simulations the note knocks out **~75%** of the time (expected ~day 22) and decumulates **~17,600 shares on average** (5th–95th percentile: 2,500–54,500). **Sources:** spot & dividend — stockanalysis.com; implied vol — MarketChameleon / option term structure; USD rate — U.S. Treasury 3-month bill.

Important. This one-pager is indicative and for discussion only. It is a private, non-binding illustration prepared by Xie Family Office for the family's own use; it is **not** an offer, a solicitation, investment advice, or a term sheet, and it is not a product of any bank. Figures are model estimates based on the market data shown and standard option-pricing assumptions; **actual dealer quotes will differ** and will include the bank's spread. A decumulator can **oblige you to sell shares (at 2x size) below the prevailing market** and can end early, capping the quantity sold; you give up upside above the strike. Volatility is an assumption, not a guarantee. Past performance and simulated outcomes do not predict future results.
